

Ecological site R024XY006OR LAKE TERRACE

Accessed: 04/29/2026

General information

Provisional. A provisional ecological site description has undergone quality control and quality assurance review. It contains a working state and transition model and enough information to identify the ecological site.

Table 1. Dominant plant species

| | |
|------------|-------------------------------|
| Tree | Not specified |
| Shrub | Not specified |
| Herbaceous | (1) <i>Leymus triticoides</i> |

Physiographic features

This site occurs on the floors of low elevation dry lake basins and valley bottoms. It is typically found on flat areas appearing as the first low terrace above a playa. A seasonal water table is present. Slopes typically range from 0 to 3 percent. Elevations range from 4200 to 5200 feet.

Table 2. Representative physiographic features

| | |
|--------------------|------------------------------------|
| Landforms | (1) Lake plain (2) Lake terrace |
| Flooding frequency | None |
| Ponding duration | Long (7 to 30 days) |
| Ponding frequency | Frequent |
| Elevation | 1,280 – 1,590 m |
| Slope | 0 % |
| Water table depth | 0 – 80 cm |
| Aspect | Aspect is not a significant factor |

Climatic features

The annual precipitation ranges from 8 to 10 inches, most of which occurs in the form of rain and snow during the months of December through April. Additional moisture is cyclically supplied to the site by spring run-off from surrounding upland sites. The soil temperature is mesic to frigid near mesic with a mean air temperature of 47 degrees F. Temperature extremes range from 100 to -10 degrees F. The frost-free period ranges from 70 to 110 days. The optimum period for plant growth is from late April to early July.

Table 3 Representative climatic features

| | |
|-------------------------------|----------|
| Frost-free period (average) | 110 days |
| Freeze-free period (average) | 0 days |
| Precipitation total (average) | 250 mm |

Influencing water features

Soil features

The soils of this site are fine textured, very deep and poorly drained. The surface layer is a silt to silty clay loam 2 to 8 inches over a silty clay subsoil. Substratums are lacustrine sediments. Soils are only mildly sodium affected. Shallow ponding typically occurs for short periods in the spring. Extended long duration deep ponding over a larger area is infrequent occurring three in fifty years. Permeability is slow to moderately slow. The available water holding capacity (AWC) is 1 to 7 inches. Depth to a seasonal water table is normally 0 to 30

inches. The potential for wind and water erosion is slight.

Table 4. Representative soil features

| | |
|---|---|
| Parent material | (1) Lacustrine deposits – tuff |
| Surface texture | (1) Loam (2) Clay loam |
| Family particle size | (1) Clayey |
| Drainage class | Poorly drained to somewhat poorly drained |
| Permeability class | Slow to moderately slow |
| Soil depth | 150 cm |
| Available water capacity (0-101.6cm) | 1.27 – 18.29 cm |
| Calcium carbonate equivalent (0-101.6cm) | 0 – 20 % |
| Electrical conductivity (0-101.6cm) | 0 – 30 mmhos/cm |
| Sodium adsorption ratio (0-101.6cm) | 0 – 200 |
| Soil reaction (1:1 water) (0-101.6cm) | 7.4 – 9.6 |

Ecological dynamics

The reference native plant community is strongly dominated by a uniform stand of beardless (creeping) wildrye. Other grasses and forbs are minor. Vegetative composition is greater than 95 percent grass/grass-like and 5 percent forbs. Shrubs are absent. The approximate ground cover is 70 to 80 percent (basal and crown).

Three states have been identified for this site: a reference state; a state with the presence of annual weeds; and a state with annual dominance. Annual production will fluctuate with the extent and duration of flooding, surface ephemeral flows or seasonal depth to ground water.

Reference State: The role of fire is unknown. The introduction of invasive annual weeds transitions into state 2.

State 2: Compositionally similar to the reference state with a trace of annual weeds. Ecological function has not changed, however the resiliency of the state has been reduced by the presence of invasive weeds. Prescribed grazing maintains state dynamics. Improper grazing management leads to a decline in perennial grasses and an increase in annual weeds creating an at-risk community phase. Prescribed grazing may reverse this trend. Continuous mismanagement of grazing practices leads to state 3.

State 3: Annual weeds control site resources and drive ecological dynamics. Bare ground is abundant. Creeping wildrye exists in patches. Bunchgrasses may be present in trace amounts. Decadent sagebrush may be present on some sites. Spatial and temporal energy capture and nutrient cycling has been truncated. Infiltration may be reduced due to reduced ground cover.

Range in Characteristics-

This site is very uniform in appearance with little variation in creeping wildrye composition. Along moist fringe areas rushes and other wetland species increase. Production will fluctuate with the duration and depth of available subsurface moisture. Occasional to rare flooding events will increase the presence of wetland species for a short period of time and eliminate shrub encroachment from associated sites.

Response to Disturbance - States

If the condition of the site deteriorates as a result of over grazing, beardless (creeping) wildrye will decrease in the stand. Poverty weed will increase. With further deterioration annual mustards and other forbs invade. Bare ground becomes extensive under deteriorated conditions.

States: IVAX-annual and other forbs/bare ground; Bare ground

State and transition model

Additional community tables

Table 5. Community 1.1 plant community composition

| Group | Common Name | Symbol | Scientific Name | Annual Production () | Foliar Cover (%) |
|------------------------|--|--------|----------------------------------|----------------------|------------------|
| Grass/Grasslike | | | | | |
| 1 | Moderately-deep rooted rhizomatus grass | | | 605-673 | |
| | beardless wildrye | LETR5 | <i>Leymus triticoides</i> | 605-673 | – |
| 4 | Other perennial grasses and grass-like | | | 20-40 | |
| | squirreltail | ELEL5 | <i>Elymus elymoides</i> | 0-20 | – |
| | spikerush | ELEOC | <i>Eleocharis</i> | 0-20 | – |
| | rush | JUNCU | <i>Juncus</i> | 0-20 | – |
| | mat muhly | MURI | <i>Muhlenbergia richardsonis</i> | 0-20 | – |
| | bluegrass | POA | <i>Poa</i> | 0-20 | – |
| Forb | | | | | |
| 6 | Perennial forbs | | | 7-13 | |
| | povertyweed | IVAX | <i>Iva axillaris</i> | 7-13 | – |
| | dock | RUMEX | <i>Rumex</i> | 7-13 | – |
| 7 | Other perennial forbs | | | 0-7 | |
| | arnica | ARNIC | <i>Arnica</i> | 0-7 | – |
| | evening primrose | OENOT | <i>Oenothera</i> | 0-7 | – |
| | knotweed | POLYG4 | <i>Polygonum</i> | 0-7 | – |
| | candytuft | SMELO | <i>Smelowskia</i> | 0-7 | – |
| | fiveleaf clover | TRAN | <i>Trifolium andersonii</i> | 0-7 | – |

Animal community

Livestock Grazing: This site can easily be damaged if grazed when the soils are wet. It is well suited for livestock grazing use in the summer and fall under a planned grazing system. Use should be postponed until the soils are firm enough to prevent trampling damage and soil compaction. Grazing management should be keyed for creeping wildrye. Creeping wildrye can be severely damaged if heavily

grazed during periods of grass seed formation before root reserves have accumulated and soil moisture is low. Deferred grazing or rest is recommended at least once every three years. Wildlife: This site provides water for numerous species of wildlife and waterfowl when ponded. Antelope prefer this site and make excellent use of it when forage is readily available. Various species use this site during the fall and winter. Cover is limited.

Hydrological functions

The soils of this site are typically near the lowest topographic position and when occasionally ponded have little runoff potential. Occasional very shallow ponding is extensive because of low soil intake rates. The hydrologic cover condition is good when the ecological condition is high. Hydrologic cover is high when creeping wildrye is greater than 70 percent of potential. The soils are in hydrologic group D.

Other information

This site has poor potential for range seeding because of occasional ponding, clayey subsoils and the present lack of creeping wildrye seed.

Rangeland health reference sheet

Interpreting Indicators of Rangeland Health is a qualitative assessment protocol used to determine ecosystem condition based on benchmark characteristics described in the Reference Sheet. A suite of 17 (or more) indicators are typically considered in an assessment. The ecological site(s) representative of an assessment location must be known prior to applying the protocol and must be verified based on soils and climate. Current plant community cannot be used to identify the ecological site.

Indicators

1. Number and extent of rills:

2. Presence of water flow patterns:

3. Number and height of erosional pedestals or terracettes:

4. Bare ground from Ecological Site Description or other studies (rock, litter, lichen, moss, plant canopy are not bare ground):

5. Number of gullies and erosion associated with gullies:

6. Extent of wind scoured, blowouts and/or depositional areas:

7. Amount of litter movement (describe size and distance expected to travel):

8. Soil surface (top few mm) resistance to erosion (stability values are averages - most sites will show a range of values):

9. Soil surface structure and SOM content (include type of structure and A-horizon color and thickness):

10. Effect of community phase composition (relative proportion of different functional groups) and spatial distribution on infiltration and runoff:

11. Presence and thickness of compaction layer (usually none; describe soil profile features which may be mistaken for compaction on this site):

12. Functional/Structural Groups (list in order of descending dominance by above-ground annual-production or live foliar cover using symbols: >>, >, = to indicate much greater than, greater than, and equal to):

Dominant:

Sub-dominant:

Other:

Additional:

13. Amount of plant mortality and decadence (include which functional groups are expected to show mortality or decadence):

14. Average percent litter cover (%) and depth (in):

15. Expected annual annual-production (this is TOTAL above-ground annual-production, not just forage annual-production):

16. Potential invasive (including noxious) species (native and non-native). List species which BOTH characterize degraded states and have the potential to become a dominant or co-dominant species on the ecological site if their future establishment and growth is not actively controlled by management interventions. Species that become dominant for only one to several years (e.g., short-term response to drought or wildfire) are not invasive plants. Note that unlike other indicators, we are describing what is NOT expected in the reference state for the ecological site:

17. Perennial plant reproductive capability:
