

# Ecological site F043BP906MT

## Subirrigated Cold Woodland Group

Last updated: 3/01/2024  
Accessed: 09/08/2026

### General information

**Provisional.** A provisional ecological site description has undergone quality control and quality assurance review. It contains a working state and transition model and enough information to identify the ecological site.

### MLRA notes

Major Land Resource Area (MLRA): 043B–Central Rocky Mountains

The Central Rocky Mountains (MLRA 43B) of Montana occupy some 28,850 square miles and exist primarily in Central and SW portions of the state. The climate is extremely variable with precipitation lows of 9 to 100 inches per year and frost-free days of less than 30 to over 110 days. The geology of the region is also highly variable. The combination of variable climate and geology create a complex relationship of plant communities. MLRA 43B elevations typically exist between 6000 and 12,799 ft at Granite Peak (the highest point in Montana). The Continental Divide runs through this MLRA effectively splitting its watershed to contribute to either the Missouri River to the East and the Columbia River to the West.

### Ecological site concept

• Dominant Cover: Forest • Site receives additional water • This site occurs on low terraces adjacent to flood plains of perennial or intermittent streams (though not in the floodplain), near springs and seeps, or other areas having a permanent or perched water table. • Seasonal high water table within 40" (approx. 100cm) of soil surface. • Moisture Regime: udic • Temperature Regime: cryic • Soils are o Not saline or saline-sodic o Moderately deep, deep, or very deep o Typically less than 5% stone and boulder cover (10% max) • Area of rugged mountain, hills, plateaus, and valleys of the Central Rocky Mountains in Southwest Montana. • Parent material is alluvium, colluvium • Elevation Range: 6000-10000 ft • Slope: 0-15%

### Associated sites

### Physiographic features

Site occurs on low terraces adjacent to flood plains or perennial or intermittent streams, near springs and seeps, or other areas having permanent or perched water tables. Slopes will vary from nearly level to less than 15 percent. This ecological site exists between 6000 and 10000 feet elevation.

Table 2. Representative physiographic features

|                   |                                    |
|-------------------|------------------------------------|
| Landforms         | (1) Mountains > Stream terrace     |
| Elevation         | 1,830 – 3,050 m                    |
| Slope             | 0 – 20 %                           |
| Water table depth | 0 – 100 cm                         |
| Aspect            | Aspect is not a significant factor |

### Climatic features

This climate of this site is considered cold and exists in the cryic soil temperature regime and in the the udic soil moisture regime. Average Relative Effective Annual Precipitation is 20 to 70 inches and 20 to 70 days frost-free.

Table 3 Representative climatic features

|                                            |            |
|--------------------------------------------|------------|
| Frost-free period (characteristic range)   | 0-20 days  |
| Freeze-free period (characteristic range)  | 40-70 days |
| Precipitation total (characteristic range) | 410-660 mm |
| Frost-free period (actual range)           | 0-30 days  |
| Freeze-free period (actual range)          | 40-90 days |
| Precipitation total (actual range)         | 330-710 mm |
| Frost-free period (average)                | 10 days    |

|                               |         |
|-------------------------------|---------|
| Freeze-free period (average)  | 60 days |
| Precipitation total (average) | 530 mm  |

### Influencing water features

Site is located adjacent to the flood plain of perennial or intermittent streams; however, the site is not located in the floodplain. Site receives additional moisture from these nearby streams and will have a water table within 40 inches of the soil surface.

### Wetland description

Site is not a wetland

### Soil features

Soils are derived from alluvium or alluvium over colluvium. Textures will vary based on local geology; however, the profile will typically have a deep organic layer over mineral soil. Soils will express multiple C-horizons with limited development. Soil surface textures are sandy or loamy with gravelly or cobbly modifiers

Table 4. Representative soil features

|                                         |                                                                                                                       |

| Subsurface fragment volume >3"<br>(25.4-50.8cm)  | 0 – 30 % |

## Ecological dynamics

### 1 - Reference State

1.1 Englemann's spruce and subalpine fir dominated forest. Shrubs dominate understory canopy.

T1A Post-disturbance includes stand replacement fire (primary driver in this community), insect pestilence and disease. Fire frequency is long but fire is intense.

### 2 - Post-disturbance State

2.1 Shrub dominant condition post-disturbance. Saplings of multiple trees present. Forbs increase in composition particularly colonizing species like fireweed and coneflower

2.1A Time where trees start to re-establish

R2A Restoration pathway where the site, over time, without fire, insect pestilence, or disease moves back to the Reference State. Englemann's spruce with subalpine fir comes back in and shades out the other tree species. This process can take over 150 years.

### Site Development and Testing Plan

This Provisional Ecological Site Description was developed to meet the criteria as defined in Soil Survey National Instruction part 306 (430-306-NI, April 2015) as interpreted by Regional Ecological Site Specialist. Information in this description are first approximations based on broad groupings of soil properties and vegetation characteristics associated with those groupings. Although this description has been through the quality control and quality assurance review process it has not been certified for use in conservation planning.

## State and transition model

## Additional community tables

### Animal community

This ecological site is considered important habitat for large wild game such as deer, elk, and moose as well as upland birds such as ruffed, dusky, and spruce grouse. Typically this site is considered marginal to poor for livestock grazing.

## Hydrological functions

Site is adjacent to stream and water sources. The plant community typically acts as a buffer for these smaller systems. Degradation of the site may result in increased seasonal runoff and stream sedimentation.

## Recreational uses

Site frequently used by many outdoor recreationists such as bird watchers, campers, hikers, bikers, and hunters.

## Wood products

The dominant forest type is typically not suited to forest products. Site location adjacent to stream acts as a forest riparian buffer and not considered appropriate for timber harvest as per Best Management Practices (BMPs).

## Inventory data references

Information presented was derived from NRCS inventory data, literature, field observations, and personal contacts with range-trained personnel (i.e., used professional opinion of agency specialists, observations of land managers, and outside scientists).

## Rangeland health reference sheet

**Interpreting Indicators of Rangeland Health** is a qualitative assessment protocol used to determine ecosystem condition based on benchmark characteristics described in the Reference Sheet. A suite of 17 (or more) indicators are typically considered in an assessment. The ecological site(s) representative of an assessment location must be known prior to applying the protocol and must be verified based on soils and climate. Current plant community cannot be used to identify the ecological site.

## Indicators

### 1. Number and extent of rills:

---

### 2. Presence of water flow patterns:

---

### 3. Number and height of erosional pedestals or terracettes:

---

### 4. Bare ground from Ecological Site Description or other studies (rock, litter, lichen, moss, plant canopy are not bare ground):

---

### 5. Number of gullies and erosion associated with gullies:

---

### 6. Extent of wind scoured, blowouts and/or depositional areas:

---

### 7. Amount of litter movement (describe size and distance expected to travel):

---

### 8. Soil surface (top few mm) resistance to erosion (stability values are averages - most sites will show a range of values):

---

### 9. Soil surface structure and SOM content (include type of structure and A-horizon color and thickness):

---

10. Effect of community phase composition (relative proportion of different functional groups) and spatial distribution on infiltration and runoff:

---

11. Presence and thickness of compaction layer (usually none; describe soil profile features which may be mistaken for compaction on this site):

---

12. Functional/Structural Groups (list in order of descending dominance by above-ground annual-production or live foliar cover using symbols: >>, >, = to indicate much greater than, greater than, and equal to):

Dominant:

Sub-dominant:

Other:

Additional:

---

13. Amount of plant mortality and decadence (include which functional groups are expected to show mortality or decadence):

---

14. Average percent litter cover (%) and depth ( in):

---

15. Expected annual annual-production (this is TOTAL above-ground annual-production, not just forage annual-production):

---

16. Potential invasive (including noxious) species (native and non-native). List species which BOTH characterize degraded states and have the potential to become a dominant or co-dominant species on the ecological site if their future establishment and growth is not actively controlled by management interventions. Species that become dominant for only one to several years (e.g., short-term response to drought or wildfire) are not invasive plants. Note that unlike other indicators, we are describing what is NOT expected in the reference state for the ecological site:

---

17. Perennial plant reproductive capability:

---
